Chapter 15

Monopoly
Why Monopolies Arise

- **Market power**
  - Alters the relationship between a firm’s costs and the selling price

- **Monopoly**
  - Charges a price that exceeds marginal cost
  - A high price reduces the quantity purchased
  - Outcome: often not the best for society
Why Monopolies Arise

- **Governments**
  - Can sometimes improve market outcome

- **Monopoly**
  - Firm that is the sole seller of a product without close substitutes
  - Price maker
  - Cause: barriers to entry
Why Monopolies Arise

• Barriers to entry
  – A monopoly remains the only seller in the market
    • Because other firms cannot enter the market and compete with it
  1. Monopoly resources
  2. Government regulation
  3. The production process

Why Monopolies Arise

• Monopoly resources
  – A key resource required for production is owned by a single firm
  – Higher price

“Rather than a monopoly, we like to consider ourselves ‘the only game in town.’”

Why Monopolies Arise

• Government regulation
  – Government gives a single firm the exclusive right to produce some good or service
  – Government-created monopolies
    • Patent and copyright laws
    • Higher prices
    • Higher profits
Why Monopolies Arise

• **Natural monopoly**
  – A single firm can supply a good or service to an entire market
    • At a smaller cost than could two or more firms
  – Economies of scale over the relevant range of output
When a firm’s average-total-cost curve continually declines, the firm has what is called a natural monopoly. In this case, when production is divided among more firms, each firm produces less, and average total cost rises. As a result, a single firm can produce any given amount at the lowest cost.
Production and Pricing Decisions

- **Monopoly**
  - Price maker
  - Sole producer
  - Downward sloping demand: the market demand curve

- **Competitive firm**
  - Price taker
  - One producer of many
  - Demand is a horizontal line (Price)
Figure 2 Demand Curves for Competitive and Monopoly Firms

(a) A Competitive Firm’s Demand Curve

(b) A Monopolist’s Demand Curve

Because competitive firms are price takers, they face horizontal demand curves, as in panel (a). Because a monopoly firm is the sole producer in its market, it faces the downward-sloping market demand curve, as in panel (b). As a result, the monopoly has to accept a lower price if it wants to sell more output.

Production and Pricing Decisions

• A monopoly’s marginal revenue
  – Revenue per each additional unit of output
    • Change in total revenue when output increases by 1 unit
  – MR < P
    • Downward-sloping demand
    • To increase the amount sold, a monopoly firm must lower the price it charges to all customers
  – Can be negative

Production and Pricing Decisions

• Increase in quantity sold
  – Output effect
    • Q is higher: increase total revenue
  – Price effect
    • P is lower: decrease total revenue

• Because MR < P
  – Marginal-revenue curve is below the demand curve
Output and price effect

Price effect

Figure 3 Demand and Marginal-Revenue Curves for a Monopoly

Production and Pricing Decisions

- **Profit maximization**
  - If MR > MC: increase production
  - If MC > MR: produce less
  - Maximize profit
    - Produce quantity where MR=MC
    - Intersection of the marginal-revenue curve and the marginal-cost curve
    - Price: on the demand curve
Figure 4 Profit Maximization for a Monopoly

1. The intersection of the marginal-revenue curve and the marginal-cost curve determines the profit-maximizing quantity...

2. . . . and then the demand curve shows the price consistent with this quantity.

Production and Pricing Decisions

- **Profit maximization**
  - Perfect competition: \( P = MR = MC \)
    - Price equals marginal cost
  - Monopoly: \( P > MR = MC \)
    - Price exceeds marginal cost

- **A monopoly’s profit**
  - Profit = Total Revenue - Total Cost = \((P - ATC) \times Q\)
Figure 5 The Monopolist’s Profit

The Welfare Cost of Monopolies

• **Monopoly**
  – Produce quantity where MC = MR
  – Produces less than the socially efficient quantity of output
  – Charge P > MC
  – Deadweight loss
    • Triangle between the demand curve and MC curve
Figure 8 The Inefficiency of Monopoly

Price Discrimination

- Price discrimination
  - Business practice
  - Sell the same good at different prices to different customers
  - Rational strategy to increase profit
  - Requires the ability to separate customers according to their willingness to pay
  - Can raise economic welfare
Price Discrimination

• Perfect price discrimination
  – Charge each customer a different price
    • Exactly his or her willingness to pay
  – Monopoly firm gets the entire surplus (Profit)
  – No deadweight loss
Price Discrimination

- Without price discrimination
  - Single price > MC
  - Consumer surplus
  - Producer surplus (Profit)
  - Deadweight loss
Panel (a) shows a monopoly that charges the same price to all customers. Total surplus in this market equals the sum of profit (producer surplus) and consumer surplus. Panel (b) shows a monopoly that can perfectly price discriminate. Because consumer surplus equals zero, total surplus now equals the firm’s profit. Comparing these two panels, you can see that perfect price discrimination raises profit, raises total surplus, and lowers consumer surplus.
Price Discrimination

- Examples of price discrimination
  - Movie tickets
    - Lower price for children and seniors
  - Airline prices
    - Lower price for round-trip with Saturday night stay

“Would it bother you to hear how little I paid for this flight?”
Price Discrimination

- Examples of price discrimination
  - Discount coupons
    - Not all customers are willing to spend time to clip coupons
  - Financial aid
    - High tuition and need-based financial aid
    - Willingness to pay
  - Quantity discounts
    - Customer pays a higher price for the first unit bought than for the last unit bought

Public Policy Toward Monopolies

1. Increasing competition with antitrust laws
   – Sherman Antitrust Act, 1890
   – Clayton Antitrust Act, 1914
   – Prevent mergers
   – Break up companies
   – Prevent companies from coordinating their activities to make markets less competitive

“But if we do merge with Amalgamated, we’ll have enough resources to fight the anti-trust violation caused by the merger.”
Public Policy Toward Monopolies

2. Regulation

– Regulate the behavior of monopolists
  • Price
– Common in case of natural monopolies
– Marginal-cost pricing
  • May be less than ATC
  • No incentive to reduce costs

Figure 10  Marginal-Cost Pricing for a Natural Monopoly

3. Public ownership

– How the ownership of the firm affects the costs of production

– Private owners
  • Incentive to minimize costs

– Public owners (government)
  • If it does a bad job, losers are the customers and taxpayers
4. Do nothing

– Some economists argue that it is often best for the government not to try to remedy the inefficiencies of monopoly pricing

– Determining the proper role of the government in the economy requires judgments about politics as well as economics
### Table 3 Competition versus Monopoly: A Summary Comparison
